

Overview: Gather data from Google app store reviews to see what percentage of reviews are AI generated vs human written.

Objective: to analyze how much of the review content is AI vs human and present those findings in an article with graphs and different types of analysis

Important:

- We only want to analyze data AFTER the year 2020 (2020 - present)
 - If you can't find any 2024 data, that's fine. We can make the cut off 2023
- AI content tools became publicly available around end of 2020 and early 2021, so we don't want to look at any data before then
- After scanning data for AI, remember that we are not looking for "Average" AI scores amongst the data, but rather classifying content as AI or Human (any content scan with a score of 50% or higher is classified as "AI"). Read the link below for more information.

READ THIS BEFORE STARTING:

https://docs.google.com/document/d/1CS0_TNt5l_TNBYPHpWxAIaTkqagejLK1158tY5iRRWI/edit?usp=sharing

Where to start:

- Look through this dataset:
<https://www.kaggle.com/datasets/prakharrathi25/google-play-store-reviews>
 - Is this data 2020-2023? Dig into it
- Look at more datasets on Kaggle ... so some searches and see if you can find some good datasets with the info we're looking for. This will probably be faster than manually scraping the Google App Store
- There are going to be A LOT of reviews on the Google App store. We don't need everything ... that would be too much data to analyze. Just try to find a solid dataset (most likely you can find something on Kaggle) with a good chunk of reviews for various apps between 2020-2023 (or 2024 if possible).

Once you have a good dataset, organize it and get it ready for scanning. When ready, I'll provide you API access to our AI scanner/detector at Originality.ai and we can go from there.

After content is scanned, organize all of the results (we can go over this in more detail once we get to this step).

Then you'll create some graphs, images, etc based on the results.

Then you'll write the article (again we'll go over this when we get to this step)

Process to Update Data

Since we are analyzing AI-generated content (2023-2024), the data is changing daily. In order to update the data, datasets can be used from Kaggle. There are some datasets that users have made such that they update every day with new ratings. Download these datasets, and then open them in an editor like VS Code (or something similar). Then run the different Python scripts to clean up the data (include 2023-2024 reviews, remove emojis, and < 50-word reviews). Once the dataset is ready to be scanned, run the Python script that automatically scans the CSV file using the API and then export these results and create graphs/analyze.
